

SECTRA

SECure TRAnspponder retainer

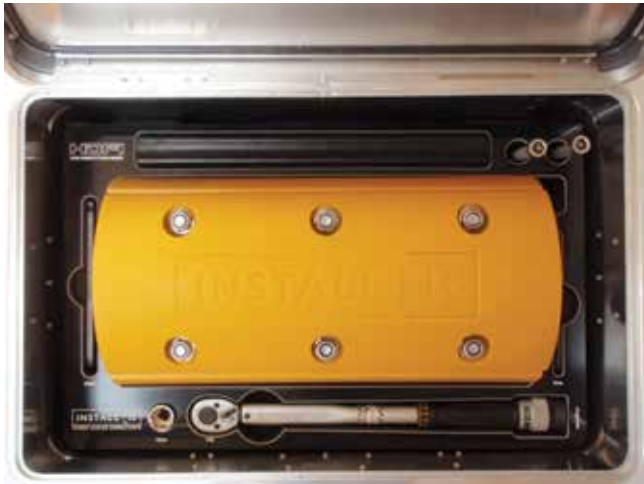

The SECTRA (SECure TRAnspponder retainer) is a transponder retaining device used for protection and positioning of transponders on crane wires. The simplicity and robustness of the system ensures a safe and reliable installation of transponders.

SECTRA firmly secures the transponder on the crane and thereby removing risk to personnel from falling transponders.

The SECTRA design also protects the transponder from impact that potentially damages a critical piece of equipment.

FEATURES

- Solid polyurethane body
- Can be fitted to a wide array of transponder types and crane wires
- Comes supplied with an aluminium storage case, full set of documentation and installation tools
- Locking mechanism can be fitted with "Monkey Fist" or similar arrangement for ROV operation

SECTRA is produced in PUR. The hardness of the PUR can be decided by customer. Default is 60 shore.
SECTRA has in a typical offshore environment a life expectancy of 20 years (given intact condition).
